3.1 File List

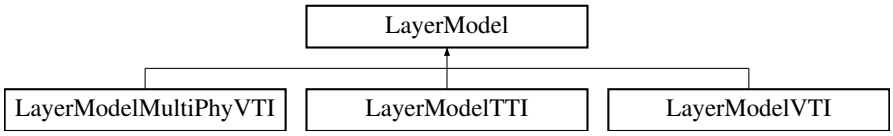
Here is a list of all documented files with brief descriptions:

Chapter 4

Class Documentation

4.1 LayerModel Class Reference

Inheritance diagram for LayerModel:



Public Member Functions

- void **initialize** ()

  initialize GLL/GRL nodes/weights
- void interp_model (const float ∗z, const float ∗param, std::vector< double > &md) const

  interpolate a model by using coordinates
- void create_mesh (const int ∗nel, const float ∗thk, const float ∗zlist, int nlayer, double scale)

  Create SEM mesh by using input model info.
- void project_kl (const float ∗z, const double ∗param_kl, double ∗kl_out) const

  project SEM-type kernels to original model

Public Attributes

- std::vector< int > **ilayer_flag**
- int **nspec**
- int **nspec_grl**
- int **nglob**
- std::vector< int > **ibool**
- std::vector< float > **skel**
- std::vector< double > **znodes**
- std::vector< double > **jaco**
- std::vector< double > **zstore**
- bool **IS_DICON_MODEL**
- double **PHASE_VELOC_MIN**
- double **PHASE_VELOC_MAX**

Protected Attributes

- std::array< double, NGLL > **xgll**
- std::array< double, NGLL > **wgll**
- std::array< double, NGRL > **xgrl**
- std::array< double, NGRL > **wgrl**
- std::array< double, NGLL ∗NGLL > **hprimeT**
- std::array< double, NGLL ∗NGLL > **hprime**
- std::array< double, NGRL ∗NGRL > **hprimeT_grl**
- std::array< double, NGRL ∗NGRL > **hprime_grl**

Static Protected Attributes

- static const int **NGLL** = 7
- static const int **NGRL** = 20

4.1.1 Member Function Documentation

4.1.1.1 create_mesh()

```
void LayerModel::create_mesh (
            const int * nel,
            const float * thk,
            const float * zlist,
            int nlayer,
            double scale)
```

Create SEM mesh by using input model info.

Parameters

nel	no. of elements for each layer, shape(nlayer - 1) for layered model, and shape(1) for continous model
thk	thickness of each layer, shape(nlayer)
zlist	cumsum(thk), shape(nlayer)
nlayer	no. of layers
scale	scale factor for GRL layer, zbot = sum(thk) + xgrl[-1] ∗ scale

4.1.1.2 interp_model()

```
void LayerModel::interp_model (
            const float * z,
            const float * param,
            std::vector< double > & md) const
```

interpolate a model by using coordinates

Parameters

z	input model z coordinates, shape(nlayer)
param	input model parameter, shape(nlayer)
md	model required to interpolate, shape(nspec∗NGLL + NGRL)

4.1.1.3 project_kl()

```
void LayerModel::project_kl (
            const float * z,
            const double * param_kl,
            double * kl_out) const
```

project SEM-type kernels to original model

Parameters

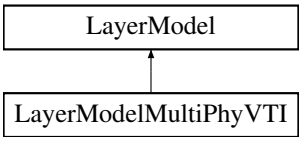
z	z coordiantes of previous model, shape(nlayer)
param_kl	SEM typed kernel, shape(nspec * NGLL + NGRL)
kl_out	kernels in original model, shape(nlayer)

The documentation for this class was generated from the following files:

- swdlayer.hpp
- shared/initialize.cpp

4.2 LayerModelMultiPhyVTI Class Reference

Inheritance diagram for LayerModelMultiPhyVTI:



Public Member Functions

- void create_database (double freq, int nlayer, const float *rho, const float *vpv, const float *vph, const float *vsv, const float *vsh, const float *eta, const float *thk, bool is_layer)

  Create layered model for multiphysics: acoustic + vti elastic.
- void **prepare_matrices** (double freq)

  prepare M/K/E matrices
- void compute_egnfun (double freq, std::vector< double > &c, std::vector< double > &egn) const

  compute dispersion curves and eigenfunction at frequency freq
- double compute_kernels (double freq, double c, const double *egn, std::vector< double > &frekl_el, std::vector< double > &frekl_ac) const

  compute group velocity and kernels for love wave
- void **transform_kernels** (std::vector< double > &frekl) const
- void **transform_ac_egnfun** ()
- void interp_model (const float *z, const float *param, bool elastic, std::vector< double > &md) const

  interpolate a model by using coordinates

Public Member Functions inherited from LayerModel

- void **initialize** ()

  initialize GLL/GRL nodes/weights
- void interp_model (const float *z, const float *param, std::vector< double > &md) const

  interpolate a model by using coordinates
- void create_mesh (const int *nel, const float *thk, const float *zlist, int nlayer, double scale)

  Create SEM mesh by using input model info.
- void project_kl (const float *z, const double *param_kl, double *kl_out) const

  project SEM-type kernels to original model

Public Attributes

- int **nspec_ac**
- int **nspec_el**
- int **nspec_ac_grl**
- int **nspec_el_grl**
- std::vector< char > **is_elastic**
- std::vector< int > **el_elmnts**
- std::vector< int > **ac_elmnts**
- int **nglob_ac**
- int **nglob_el**
- std::vector< int > **ibool_el**
- std::vector< int > **ibool_ac**
- std::vector< double > **xrho_ac**
- std::vector< double > **xkappa_ac**
- std::vector< double > **xrho_el**
- std::vector< double > **xA**
- std::vector< double > **xC**
- std::vector< double > **xL**
- std::vector< double > **xF**
- int **nfaces_bdry**
- std::vector< int > **ispec_bdry_loc**
- std::vector< char > **is_top_ac_bdry**

Public Attributes inherited from LayerModel

- std::vector< int > **ilayer_flag**
- int **nspec**
- int **nspec_grl**
- int **nglob**
- std::vector< int > **ibool**
- std::vector< float > **skel**
- std::vector< double > **znodes**
- std::vector< double > **jaco**
- std::vector< double > **zstore**
- bool **IS_DICON_MODEL**
- double **PHASE_VELOC_MIN**
- double **PHASE_VELOC_MAX**

Additional Inherited Members

Protected Attributes inherited from LayerModel

- std::array< double, NGLL > **xgll**
- std::array< double, NGLL > **wgll**

- static const int **NGRL** = 20

4.2.1 Member Function Documentation

4.2.1.1 compute_egnfun()

```
void LayerModelMultiPhyVTI::compute_egnfun (
            double freq,
            std::vector< double > & c,
            std::vector< double > & egn) const
```

compute dispersion curves and eigenfunction at frequency freq

Parameters

freq	target frequency
c	output dispersion curves, all modes, shape(nc)
egn	eigenfunctions (U,V,chi), shape(nc,nglob_el∗2 + nglob_ac)

4.2.1.2 compute_kernels()

```
double LayerModelMultiPhyVTI::compute_kernels (
            double freq,
            double c,
            const double * egn,
            std::vector< double > & frekl_el,
            std::vector< double > & frekl_ac) const
```

compute group velocity and kernels for love wave

Parameters

freq	current frequency
c	current phase velocity
egn	eigen function, shape(nglob_el∗2 + nglob_ac), (U,V,chi)
frekl_el	Frechet kernels A/C/L/F/rho_kl kernels for elastic parameters, shape(5,npts_el)
frekl_ac	Frechet kernels rho/kappa_kl kernels for acoustic parameters, shape(2,npts_el)

Returns

double u group velocity

4.2.1.3 create_database()

```
void LayerModelMultiPhyVTI::create_database (
            double freq,
            int nlayer,
            const float * rho,
            const float * vpv,
            const float * vph,
            const float * vsv,
            const float * vsh,
            const float * eta,
            const float * thk,
            bool is_layer)
```

Create layered model for multiphysics: acoustic + vti elastic.

Parameters

freq	frequency used
nlayer	# of layers used
rho,vpv,vph,vsv,vsh,eta	model parameters. shape(nlayer)
thk	thickness of each layer, shape(nlayer)
is_layer	the input model is a layered model

4.2.1.4 interp_model()

```
void LayerModelMultiPhyVTI::interp_model (
            const float * z,
            const float * param,
            bool elastic,
            std::vector< double > & md) const
```

interpolate a model by using coordinates

Parameters

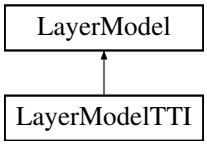
z	input model z coordinates, shape(nlayer)
param	input model parameter, shape(nlayer)
md	model required to interpolate, shape(nspec∗NGLL + NGRL)

The documentation for this class was generated from the following files:

- vti_acoustic.hpp
- frechet.cpp
- multiphysics/initialize.cpp
- sem.cpp

4.3 LayerModelTTI Class Reference

Inheritance diagram for LayerModelTTI:



Public Member Functions

- void create_database (double freq, int nlayer, const float ∗rho, const float ∗vpv, const float ∗vph, const float ∗vsv, const float ∗vsh, const float ∗eta, const float ∗theta0, const float ∗phi0, const float ∗thk, bool is_layer)

  initalize SEM mesh and create a TTI database from a layered model
- void prepare_matrices (double phi)

  prepare M/K1/K2/E matrices for TTI model
- void compute_egnfun (double freq, double phi, std::vector< double > &c, std::vector< dcmplx > &displ) const

  compute phase velocity and eigen displacements for a given direction
- std::array< double, 2 > compute_kernels (double freq, double c, double phi, const dcmplx ∗displ, std↩ ::vector< double > &frekl) const

  compute group velocity and kernels for tti model
- void transform_kernels (std::vector< double > &frekl) const

  transform kernels from base to rho/vpv/vph/vsv/vsh/eta/T/P

Public Member Functions inherited from LayerModel

- void **initialize** ()

  initialize GLL/GRL nodes/weights
- void interp_model (const float ∗z, const float ∗param, std::vector< double > &md) const

  interpolate a model by using coordinates
- void create_mesh (const int ∗nel, const float ∗thk, const float ∗zlist, int nlayer, double scale)

  Create SEM mesh by using input model info.
- void project_kl (const float ∗z, const double ∗param_kl, double ∗kl_out) const

  project SEM-type kernels to original model

Public Attributes

- std::vector< double > **xrho**
- std::vector< double > **xA**
- std::vector< double > **xC**
- std::vector< double > **xL**
- std::vector< double > **xF**
- std::vector< double > **xN**
- std::vector< double > **xT**
- std::vector< double > **xP**

Public Attributes inherited from LayerModel

- std::vector< int > **ilayer_flag**
- int **nspec**
- int **nspec_grl**
- int **nglob**
- std::vector< int > **ibool**
- std::vector< float > **skel**
- std::vector< double > **znodes**
- std::vector< double > **jaco**
- std::vector< double > **zstore**
- bool **IS_DICON_MODEL**
- double **PHASE_VELOC_MIN**
- double **PHASE_VELOC_MAX**

Additional Inherited Members

Protected Attributes inherited from LayerModel

- std::array< double, NGLL > **xgll**
- std::array< double, NGLL > **wgll**
- std::array< double, NGRL > **xgrl**
- std::array< double, NGRL > **wgrl**
- std::array< double, NGLL *NGLL > **hprimeT**
- std::array< double, NGLL *NGLL > **hprime**
- std::array< double, NGRL *NGRL > **hprimeT_grl**
- std::array< double, NGRL *NGRL > **hprime_grl**

Static Protected Attributes inherited from LayerModel

- static const int **NGLL** = 7
- static const int **NGRL** = 20

4.3.1 Member Function Documentation

4.3.1.1 compute_egnfun()

```
void LayerModelTTI::compute_egnfun (
            double freq,
            double phi,
            std::vector< double > & c,
            std::vector< dcmplx > & displ) const
```

compute phase velocity and eigen displacements for a given direction

Parameters

freq	current frequency
phi	current direction, in deg
c	phase velocity
displ	displacement

4.3.1.2 compute_kernels()

```
std::array< double, 2 > LayerModelTTI::compute_kernels (
            double freq,
            double c,
            double phi,
            const dcmplx * displ,
            std::vector< double > & frekl) const
```

compute group velocity and kernels for tti model

Parameters

freq	current frequency
c	phase velocity at this frequency
phi	azimuthal angle of c
displ	eigen function, shape(nglob ∗ 3)
frekl	Frechet kernels A/C/F/L/N/T/P/rho_kl kernels for elastic parameters, shape(8,nspec∗NGLL + NGRL)

Returns

double u group velocity and it's azimthual angle

4.3.1.3 create_database()

```
void LayerModelTTI::create_database (
            double freq,
            int nlayer,
            const float * rho,
            const float * vpv,
            const float * vph,
            const float * vsv,
            const float * vsh,
            const float * eta,
            const float * theta0,
            const float * phi0,
            const float * thk,
            bool is_layer)
```

initalize SEM mesh and create a TTI database from a layered model

Parameters

freq	current frequency
nlayer	# of nlayers
vpv/vph/vsv/vsh/eta/rho	layer model vti parameters, shape(nlayer)
theta0/phi0	axis direction

4.3.1.4 prepare_matrices()

```
void LayerModelTTI::prepare_matrices (
            double phi)
```

prepare M/K1/K2/E matrices for TTI model

Parameters

phi	polar angle of k vector, in deg

4.3.1.5 transform_kernels()

```
void LayerModelTTI::transform_kernels (
            std::vector< double > & frekl) const
```

transform kernels from base to rho/vpv/vph/vsv/vsh/eta/T/P

Parameters

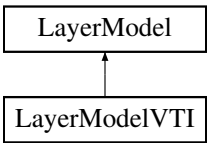
frekl	base Frechet kernels, shape(8,nspec∗NGLL+NGRL)

The documentation for this class was generated from the following files:

- swdlayertti.hpp
- sem_tti.cpp
- swdlayertti.cpp
- tti_kernels.cpp

4.4 LayerModelVTI Class Reference

Inheritance diagram for LayerModelVTI:



Public Member Functions

- void create_database (double freq, int nlayer, const float ∗rho, const float ∗vpv, const float ∗vph, const float ∗vsv, const float ∗vsh, const float ∗eta, const float ∗thk, bool is_layer)

  initalize SEM mesh and create a VTI database from a layered model
- void prepare_matrices (int wavetype)

  prepare M/K/E matrices
- void compute_slegn (double freq, std::vector< double > &c, std::vector< double > &displ) const

  compute Love wave dispersion and eigenfunctions
- void compute_sregn (double freq, std::vector< double > &c, std::vector< double > &displ) const

  compute Love wave dispersion and eigenfunctions
- double compute_love_kl (double freq, double c, const double ∗displ, std::vector< double > &frekl) const

  compute group velocity and kernels for love wave
- double compute_rayl_kl (double freq, double c, const double ∗displ, std::vector< double > &frekl) const

  compute group velocity and kernels for love wave
- void transform_kernels (std::vector< double > &frekl) const

  transform kernels from base to rho/vsv/vsh(love) and rho/vpv/vph/vsv/eta (rayleigh)

Public Member Functions inherited from LayerModel

- void **initialize** ()

  initialize GLL/GRL nodes/weights
- void interp_model (const float *z, const float *param, std::vector< double > &md) const

  interpolate a model by using coordinates
- void create_mesh (const int *nel, const float *thk, const float *zlist, int nlayer, double scale)

  Create SEM mesh by using input model info.
- void project_kl (const float *z, const double *param_kl, double *kl_out) const

  project SEM-type kernels to original model

Public Attributes

- std::vector< double > **xrho**
- std::vector< double > **xA**
- std::vector< double > **xC**
- std::vector< double > **xL**
- std::vector< double > **xF**
- std::vector< double > **xN**

- std::array< double, NGLL *NGLL > **hprime**
- std::array< double, NGRL *NGRL > **hprimeT_grl**
- std::array< double, NGRL *NGRL > **hprime_grl**

Static Protected Attributes inherited from LayerModel

- static const int **NGLL** = 7
- static const int **NGRL** = 20

4.4.1 Member Function Documentation

4.4.1.1 compute_love_kl()

```
double LayerModelVTI::compute_love_kl (
            double freq,
            double c,
            const double * displ,
            std::vector< double > & frekl) const
```

compute group velocity and kernels for love wave

Parameters

freq	current frequency
c	current phase velocity
displ	eigen function, shape(nglob)
frekl	Frechet kernels (N/L/rho) for elastic parameters, shape(3,nspec∗NGLL + NGRL)

Returns

double u group velocity

4.4.1.2 compute_rayl_kl()

```
double LayerModelVTI::compute_rayl_kl (
            double freq,
            double c,
            const double * displ,
            std::vector< double > & frekl) const
```

compute group velocity and kernels for love wave

Parameters

freq	current frequency
c	current phase velocity
displ	eigen function, shape(nglob ∗ 2)
frekl	Frechet kernels A/C/L/F/rho_kl kernels for elastic parameters, shape(5,nspec∗NGLL + NGRL)

Returns

double u group velocity

4.4.1.3 compute_slegn()

```
void LayerModelVTI::compute_slegn (
            double freq,
            std::vector< double > & c,
            std::vector< double > & displ) const
```

compute Love wave dispersion and eigenfunctions

Parameters

freq	current frequency
vmin,vmax	min/max velocity for your model
c	dispersion, shape(nc)
displ	eigen functions(displ at y direction), shape(nc,nglob)

4.4.1.4 compute_sregn()

```
void LayerModelVTI::compute_sregn (
            double freq,
            std::vector< double > & c,
            std::vector< double > & displ) const
```

compute Love wave dispersion and eigenfunctions

Parameters

freq	current frequency
vmin,vmax	min/max velocity for your model
c	dispersion, shape(nc)
displ	eigen functions(displ at x/z direction), shape(nc,2,nglob)

4.4.1.5 create_database()

```
void LayerModelVTI::create_database (
            double freq,
            int nlayer,
            const float * rho,
            const float * vpv,
            const float * vph,
            const float * vsv,
            const float * vsh,
            const float * eta,
            const float * thk,
            bool is_layer)
```

initalize SEM mesh and create a VTI database from a layered model

Parameters

freq	current frequency
nlayer	# of nlayers
vpv/vph/vsv/vsh/eta/rho	layer model vti parameters, shape(nlayer)
is_layer	if the input model is a layered (discontinuous) model

4.4.1.6 prepare_matrices()

```
void LayerModelVTI::prepare_matrices (
            int wavetype)
```

prepare M/K/E matrices

Parameters

wavetype	= 1 for Love = 2 for Rayleigh

4.4.1.7 transform_kernels()

```
void LayerModelVTI::transform_kernels (
            std::vector< double > & frekl) const
```

transform kernels from base to rho/vsv/vsh(love) and rho/vpv/vph/vsv/eta (rayleigh)

Parameters

frekl	base Frechet kernels, shape(3/5,nspec∗NGLL+NGRL)

The documentation for this class was generated from the following files:

- swdlayervti.hpp
- sem_vti.cpp
- swdlayervti.cpp
- vti_kernels.cpp

Chapter 5

File Documentation

5.1 swdio.hpp

```
00001 #include <iostream>
00002
00003 inline void __myfwrite(const void *__ptr, size_t __size, size_t __nitems, FILE *__stream)
00004 {
00005     size_t size = fwrite(__ptr,__size,__nitems,__stream);
00006     if(size != __nitems) {
00007         fprintf(stderr,"cannot write to binary!\n");
00008         exit(1);
00009     }
00010 }
00011
00012
